

Write a single page of HTML/javascript. The filename must be your name, in the form of *lastname_firstname.html* (e.g. Tiger Woods would name his file *woods_tiger.html*).

The page and script must run in recent versions of Firefox and Internet Explorer with no error messages.

Include your full name, student number and lab number as a comment at the top of the file.

The page must include javascript in an external file (named in the form of *lastname_firstname.js*), with the following behaviours:

- If javascript is turned off, or is otherwise unavailable, display a message suggesting the user is missing out on all that javascript has to offer.
- If javascript is active,
 - o Determine what kind of browser the user has (hint: investigate the properties of the 'navigator' object). Store this information in a variable.
 - o Display a message via `alert()` to the user informing them what browser you have detected.
 - o Choose an additional property of the navigator object, and display that information as well, using the `alert()` method. For example you could display:
I don't mean to be nosy, but I have noticed you are using a *Microsoft Internet Explorer* web browser, and are running a *Win32* operating system.

Test your script in at least 2 different browsers.

Submit your completed script to the IN/COMP/1911/labs/lab01 directory via the share IN directory as described here:
